Group 34 Know It's Off

Build

I actually wasn't able to successfully build the program, I got an error on yarn build "ERROR: [Errno 21] Is a directory: 'build'"
 when running it on my computer.

Legibility

Github could benefit from some better organization in folders. There is a basic hierarchy but several files were seemingly clustered together almost randomly, making for cluttered code and making it difficult to find what I wanted. Consider restructuring a bit. Also, several times looking at the code I wished there were comments to help me figure out exactly what was happening in the code. Models.py and serviceWorker are both good examples of well-documented code though and easy to follow along with. I also wished the README was a bit more thorough, letting me know what each stage of the process did and what to do after the server is running. The files in myClient/build/static are especially hard to read.

Implementation

The code itself is neither messy nor especially clean, there is a lot of self-importing that could maybe be fixed with some restructuring.

Maintainability

There didn't appear to be any unit tests, but the code is mostly for a website so unit tests aren't generally expected and difficult to do, maybe you could unit test your libraries used if anything but they're for the most part well-tested libraries. I saw some try-catches in serviceWorker.js but couldn't find examples of sending of status codes

Requirements

Looks like the team met all their requirements and the website works as intended.

Other

My biggest takeaway was that the messiness of file structure was a bit distracting and a bit of restructuring would really help with legibility, even adding a few more folders would make a world of difference.
